

1 **ABSTRACT**

2 This Application Model includes elements that define the scope of an
3 application, its startup and shutdown behavior, and how it manages windows and
4 resources; provide basic navigation functionality, journaling and journal
5 extensibility, browser integration, and Structured Navigation; and define the way
6 an application is deployed, installed, activated, updated, rolled back, and removed
7 from the system in a secure, non-impactful way. It also enables using the same
8 tools and languages for Web applications and locally installed applications, and
9 allows the same application to be hosted in the browser or in a standalone window,
10 based on a compile-time attribute.
